# INTRODUCTION

According to the World Health Organization **1 in every 8 people** in the world live with a mental disorder.

Mental disorders, significantly impact an individual's cognitive, emotional, and social functioning.

Early diagnosis is crucial for effective intervention, as it can greatly improve long-term outcomes.

# INTRODUCTION

- According to world's Alzheimer's association 1 out of 9 adults (>65) have Alzheimer's.
- Over 700,000 lives have been lost all over the world due to depression. (Global suicide statistics IASP)
- Approximately 1 out of 13 children are being diagnosed with autism. Data and Statistics on Autism Spectrum Disorder | Autism Spectrum Disorder (ASD) | CDC
- Parkinson foundation estimates that by the year 2030 the patients with Parkinson's disease will be rise to 1.2 million (https://www.parkinson.org/understanding-parkinsons/statistics)
- These diseases needed to be identified at the first stages to ensure immediate treatment. That helps patients' family members to plan their lives and keep the situation under control.

# Research Problem

- How to leverage machine and deep learning techniques to enhance mental care?
- Up to what extent machine and deep learning can be used to diagnose and analyze mental disorders like Autism, Alzheimer's, Parkinson's, and Depression?
- How trustworthy and useful are the built models?
- How to monitor patients effectively?

# Research Objectives

Diagnosing and Analyzing Alzheimer’s Risk through Machine Learning Techniques

Early Detection of Parkinson's: Harnessing Machine Learning for Predictive Risk Modeling.

Early Autism Spectrum Disorder Detection Using Facial Images and Text Analysis

Diagnosing and Analyzing Depression through Text and Facial Images

# Overall System Diagram

# Diagnosing and Analyzing Alzheimer’s Risk through Machine Learning Techniques

## IT21180934 | Dilshan G.A.M

Bachelor of Science (Hons) in Information Technology
Specializing in Data Science

# Background

## Component 1

## What is Alzeihmers?

- Alzheimer's disease is a progressive neurological disorder that leads to memory loss, cognitive decline, and behavioral changes.

# Research Question

- How to get patient sleep quality measures?
- How to develop a solution to integrate all these components in one application?
- How to feed MRI scan images into the system?
- How to manage the patient status with the medications and treatments through out the time?
- How to make clear visualizations for doctors to evaluate patients' medical history with the treatments?

# Specific & Sub Objectives

- Classifying patients’ severity using MRI scans.
- Identifying possibility of a patient having Alzheimer's using general information.
- Visualizing patient possibilities and levels of the disease through out the time.

# Methodology

# Completion & What's left?

55%

| Completed | Remaining on PP2 |
|---|---|
| Data Gathering | Evaluating the model |
| Data preprocessing | Increasing the accuracy |
| Model selecting | Implement the hybrid model |
| Basic model training | Finish remaining frontend parts |
| | |

# Data gathering

# Data Preprocessing

```python
# Check for missing values
print("\nMissing Values:")
print(data.isnull().sum())

# Handle missing values (drop rows with missing values for simplicity)
data = data.dropna()

# Encode categorical variables (if any)
label_encoders = {}
for column in data.select_dtypes(include=['object']).columns:
    le = LabelEncoder()
    data[column] = le.fit_transform(data[column])
    label_encoders[column] = le

# Feature selection and splitting the dataset
X = data.drop('Diagnosis', axis=1)  # Features (all columns except target)
X = X.drop('PatientID', axis=1)  # Drop the 'Patient ID' column
X= X.drop('DoctorInCharge', axis=1)  # Drop the 'DoctorInCharge' column
```

```python
# Import necessary libraries
import numpy as np
from imblearn.over_sampling import RandomOverSampler
from collections import Counter

# Reshape the labels to match the requirements of RandomOverSampler
labels = train_generator.classes
labels = labels.reshape(-1, 1)  # Reshape to 2D array as required by RandomOverSampler

# Initialize the RandomOverSampler
oversampler = RandomOverSampler(random_state=42)

# Get the filenames and labels for oversampling
filenames = np.array(train_generator.filepaths)  # Get filepaths of images

# Perform oversampling
oversampled_filenames, oversampled_labels = oversampler.fit_resample(filenames.reshape(-1, 1), labels)

# Flatten the oversampled_filenames back to a 1D array
oversampled_filenames = oversampled_filenames.flatten()

# Display the new distribution
oversampled_class_counts = Counter(oversampled_labels.flatten())
print(f"Original class counts: {class_counts}")
print(f"New class counts after oversampling: {oversampled_class_counts}")

# Update the train_datagen to use the oversampled data
from tensorflow.keras.preprocessing.image import array_to_img, img_to_array, load_img
```

# Model Training

```python
# Build the CNN model
model = Sequential([
    Conv2D(32, (3,3), activation='relu', input_shape=(150, 150, 3)),
    MaxPooling2D(2, 2),
    Conv2D(64, (3,3), activation='relu'),
    MaxPooling2D(2,2),
    Conv2D(128, (3,3), activation='relu'),
    MaxPooling2D(2,2),
    Conv2D(128, (3,3), activation='relu'),
    MaxPooling2D(2,2),
    Flatten(),
    Dropout(0.5),
    Dense(512, activation='relu'),
    Dense(4, activation='softmax')
])

# Compile the model
# Compile the model with the corrected optimizer parameter
model.compile(loss='categorical_crossentropy',
              optimizer=Adam(learning_rate=0.001),
              metrics=['accuracy'])
```

```python
# Scale features for better performance
scaler = StandardScaler()
X_scaled = scaler.fit_transform(X)

# Split data into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X_scaled, y, test_size=0.2, random_state=42)

# Train a Random Forest Classifier
rf_model = RandomForestClassifier(random_state=42)
rf_model.fit(X_train, y_train)

# Evaluate the model
y_pred = rf_model.predict(X_test)
print("\nClassification Report:")
print(classification_report(y_test, y_pred))

print("\nConfusion Matrix:")
sns.heatmap(confusion_matrix(y_test, y_pred), annot=True, fmt='d', cmap='Blues')
plt.title('Confusion Matrix')
plt.xlabel('Predicted')
plt.ylabel('Actual')
plt.show()

print("\nAccuracy Score:")
print(accuracy_score(y_test, y_pred))

# Feature importance visualization
feature_importances = pd.DataFrame({
    'Feature': X.columns if isinstance(X, pd.DataFrame) else data.drop('Diagnosis', axis=1).columns,
```

# Data validation

# Early Detection of Parkinson's: Harnessing Machine Learning for Predictive Risk Modeling

## IT21164026| Wijayasooriya W.A.K.A

Bachelor of Science (Hons) in Information Technology
Specializing in Data Science

# Introduction & Background

## Component 2

## What is Parkinson’s disease?

- Parkinson's disease is a progressive neurodegenerative disorder affecting millions worldwide. It primarily impacts motor functions due to the loss of dopamine-producing neurons in the brain.

# Separation of Feature Domains

**Each dataset represents a distinct feature domain.**

•Handwriting Samples Model: Focuses on motor-related symptoms (e.g., tremors or irregularities in handwriting)

•DVoice Audio Model: Targets speech-related symptoms (e.g., monotone speech, voice tremors).

•Clinical Data Model: Leverages demographic and lifestyle factors for broader risk prediction.

# Evidence Of Completion

# Predictive Model for Early Identification of Parkinson's Disease Risk Using Clinical Data

## Overview of the Dataset

```python
df = pd.read_csv('../../Datasets/parkinsons_disease_data.csv')
df.head()
```

# Early Autism Spectum Disorder Detection Using Facial Images and Text Analysis

## IT21182846 | Chamaleen D.B.N

Bachelor of Science (Hons) in Information Technology
Specializing in Data Science

# Introduction & Background

## Component 3

### What is Autism Disorder?

Autism spectrum disorder is a complex neurodevelopment condition characterized by diverse behavioral, communication, and social challenges. Its prevalence is significant globally, affecting approximately one in 160 children according to the World Health Organization. ASD diagnosis typically occurs around the age of 4.

# Introduction & Background

## What is ASD?

A neurodevelopmental disorder affecting social interaction, communication, and behavior.

## Why Early Identification of ASD?

- Reduces Clinical Burden – Helps doctors focus on real cases, avoiding unnecessary tests.
- Faster Support – Early diagnosis allows quicker therapy and better outcomes.
- Lower Costs – Reduces long-term medical and education expenses.
- Better Life Quality – Early help improves social and learning skills.

# Research Question?

- How to identify autism patient face detections in an application?
- How to develop self-manageable platform?
- How can we collect more and better-quality data to improve  ML models for early ASD diagnosis?
- How to gather text base questions' answers?

# Research Question?

### Challenges in Existing ASD Detection Methods

- Delayed Diagnosis – Traditional screening takes time and requires expert evaluation.
- Questionnaire answers may not always be accurate – People can misunderstand or give biased responses.
- Text-only data may miss key signs – Facial expressions and behaviors provide important clues that text responses can't capture.

### Why Combine Facial Images & Questionnaire Data?

- Improves Accuracy – Combining both methods gives a more reliable diagnosis.
- Captures More Features – Facial expressions and behavior patterns complement questionnaire responses.
- Faster Screening – Reduces dependency on clinical visits and speeds up early intervention.

# Evidence of Completion

# Facial Image-Based Predictive Model for Early ASD Detection

Table 1: Details of variables mapping to the Q-Chat-10 screening methods

| **Variable in Dataset** | **Corresponding Q-chat-10-Toddler Features** |
|---|---|
| A1 | Does your child look at you when you call his/her name? |
| A2 | How easy is it for you to get eye contact with your child? |
| A3 | Does your child point to indicate that s/he wants something? (e.g. a toy that is out of reach) |
| A4 | Does your child point to share interest with you? (e.g. poin9ng at an interes9ng sight) |
| A5 | Does your child pretend? (e.g. care for dolls, talk on a toy phone) |
| A6 | Does your child follow where you're looking? |
| A7 | If you or someone else in the family is visibly upset, does your child show signs of wan9ng to comfort them? (e.g. stroking hair, hugging them) |
| A8 | Would you describe your child's first words as: |
| A9 | Does your child use simple gestures? (e.g. wave goodbye) |
| A10 | Does your child stare at nothing with no apparent purpose? |

# Data Preprocessing

## Handling Missing Values & Data Inspection

```
[ ] # 0. Initial Data Inspection and Missing Value Handling

    # Replace '?' with 'others' in 'relation' and 'ethnicity' columns if they exist
    for col in ['relation', 'ethnicity']:
        if col in df.columns:
            df[col] = df[col].replace('?', 'others')
```

## Encoding Categorical Features

```
[ ] # 1. Data Preprocessing

    # a. Convert categorical features to numerical
    for col in ['Sex', 'Jaundice', 'Family_mem_with_ASD', 'Class/ASD Traits ']: #add space at the end
        le = LabelEncoder()
        # Check if the column exists before transforming it
        if col in df.columns:  # Check if the column name is present
            df[col] = le.fit_transform(df[col])
        else:
            print(f"Warning: Column '{col}' not found in the DataFrame.") # This will print a warning if the column is not found
```

## Handling Class Imbalance with SMOTE (Synthetic Minority Over-sampling Technique)

```
# c. Handle Class Imbalance with SMOTE
smote = SMOTE(random_state=42)
X_train, y_train = smote.fit_resample(X_train, y_train)
```

## Feature Engineering: Q-Chat-10 Score Calculation

```
[ ] # 2. Feature Engineering: Q-Chat-10 Score Calculation

    def calculate_qchat_score(row):
        """Calculates the Q-Chat-10 score based on the specified rules."""
        score = 0
        for i in range(1, 10):  # A1 to A9
            if row[f'A{i}'] == 1:
                score += 1
        if row['A10'] == 1:
            score += 1
        return score

    df['Qchat_Score'] = df.apply(calculate_qchat_score, axis=1)

    # Create a binary ASD Traits variable based on the Qchat_Score
    df['ASD_Traits'] = df['Qchat_Score'].apply(lambda x: 1 if x > 3 else 0)
```

## Feature Selection Using P-values

```
[ ] # 3. Feature Selection Based on P-values

    def calculate_p_value(feature, target):
        """Calculates the p-value for a feature using the Chi-Square test."""

# Conclusion & Future Work

- Conclusion

  - Successfully developed an ASD detection model using facial images & text data.
  - Fusion of both modalities improves accuracy compared to single-method approaches.
  - Can assist in early screening and reduce clinical workload.

- Future Work

  - Expand Dataset – Collect more diverse facial images for better generalization.
  - Enhance Model Features – Integrate more behavioral and facial analysis techniques.
  - Real-Time Implementation – Develop a mobile or web-based screening tool.
  - Clinical Validation – Collaborate with healthcare professionals for real-world testing.

# Specific & Sub Objectives

- Detect ASD traits using facial image analysis.
- Analyze questionnaire responses to identify ASD indicators.
- Combine both methods for better accuracy using a weighted approach.
- Giving the visualization report for current situation of each patient
- Verify the prediction result use in clinical data

# Diagnosing and Analyzing Depression Through Text and Facial Images

## IT21178368 | Perera K.K.S

Bachelor of Science (Hons) in Information Technology
Specializing in Data Science

# Introduction & Background

## Component 4

### What is Depression?

- Depression is a common mental disorder.
- Globally, an estimated 5% of adults suffer from depression.
- It involves a depressed mood or loss of pleasure or interest in activities **for long periods of time.**
- Depression can lead to suicide.

# Research Questions

- How general practitioners can easily diagnose mental disorder like Depression?
- How can practitioners monitor and examine depression patients' behaviors effectively?

# Specifics and Sub Objectives

- Initially determining whether a patient is at risk of having depression.
- Monitoring patients' behavior daily by collecting text inputs and facial images together.
- Give analysis/summary about patients’ current status to doctor.

# Methodology

# Completion & What's left?

55%

| Completed | Remaining on PP2 |
|---|---|

# Business Plan of MENTCARE AI

**April 2024**
Project Initiation

**August 2024**
Finalize Architecture

**September 2024**
Model Development and Implementation

**October 2024**
Begin development of platform

**Q1 2025**
Complete development of platform and have a working prototype

**Q2 2025**
Release Mentcure to the market

**Q2 2025**
Begin marketing campaigns and outreach programs for user acquisition

**Q3 2025**
Expand the functionality of the platform and focus on new features

SLIIT FACULTY OF COMPUTING

**Group ID: 24-25J-322**

# Commercialization

## Target Market

General Practitioners of the MOH centers

Institutes who learn about mental disorders

General population who wish to take self mental care

## Market Size

~12.5% of the world population

## Market Access Points

MOH Center

Mentcare Web

# Q & A Session

# Thank you for your attention
